Another Reflection on ChatGPT

I'll begin by saying that revisiting ChatGPT was a delightful yet disappointing experience. However, it helps to raise a point about the capabilities of AI. Starting with what I did on my end, I created a funny little game about a pea on a platter that has to escape the plate. It's fun and cute, has enemy vegetables, and has a lot of flair, including the title, name, and setting. Again, doing all the coding and putting the pieces together took considerable time, and I had to rework many things to make sure they worked the way I wanted.

I then asked ChatGPT to generate a game about an evil dish that goes crazy everywhere. What it generated at first was just a red circle bouncing everywhere. I then asked it to generate a player circle and a funny mouse event that flashed "WHERE'S THE BEEF?" in the center. It created a player circle, but the mouse event failed, and the player circle wouldn't move no matter what I asked the AI to do. All I have is a blue circle that stares at a red circle bouncing everywhere.

Overall, this made me ponder and think about the current state of AI. When asked to do simple things, it succeeds. But the more esoteric the command becomes, the more it struggles to help fulfill what the user would want. I wanted a GAME that I could play. Instead, it did the bare minimum when asked, yet it still wasn't enough. Of course, I would have to grill the AI hard to get what I want to the pixel, but that takes a long time. AI often misses out on flair and pizzazz because it's trying to execute the bare minimum. Which is fine, but I think this is one of the

things humanity still has a grip on. Humans can easily place pizzazz mindlessly when creating something, whereas AI is only concerned with the bare minimum and specific directions asked of it.

Overall, it is another exciting venture into ChatGPT. This helped me think about the state of AI in terms of coding and where I believe humanity still has at least one advantage.
